6. Risk Calculator - Fire

The following risk estimator is based on the general health and safety risk level estimator contained within BS 8800: 1996. Guide to occupational health and safety management systems.

1. Taking into account the fire prevention measures observed at the time of this risk assessment, it is considered that the hazard from the fire (the probability of ignition) at this building is:

(please insert x below)

X

LOW MEDIUM

HIGH

2. Taking into account the nature of the building, the occupants, the fire protection afforded and any procedural arrangements observed at the time of the assessment, it is considered that the consequences for life safety in the event of a fire would be:

(please insert x below)

The definition of the above terms is as follows:

FRA Review Frequency				
MINOR	Outbreak of fire is unlikely to result in serious injury or death of any occupant			
	(other than the occupant sleeping in a bedroom in which a fire occurs).			
MAJOR	An outbreak of fire could result in injury of one or more occupants, but is unlikely			
	to lead to fatalities.			
CRITICAL	There is significant potential for serious injury or death of one or more occupants.			

3. The above estimates are then read into the following matrix table to give the overall risk level for the site:

Fire Hazard	Minor	Major	Critical
Low	Trivial	Tolerable	Moderate
Medium	Tolerable	Moderate	Substantial
High	Moderate	Substantial	Intolerable

When the level of risk is established, the action level can be read from the table below:

Risk Level	Guide to actions and appropriate timescales
Trivial	No action is required
Moderate	Efforts should be made to reduce the risk level and this
	should be carried out within the specified time periods.
Substantial	Considerable resources may have to be allocated to
	reduce the risk level. It may be necessary to limit the
	occupation of some parts until urgent remedial action is
Intolerable	The building (or the relevant area) should not be occupied
	until the risk is reduced.
